21 May 2024

# IMPROVER project: Integrated Model post-Processing and Verification

Project completed earlier this year and the system is now operational.  
Output available as the **Met Office Blended Probabilistic Forecast**

MOGREPS-UK:  
18-member  
regional ensemble

## **Principle objective:**

Produce a scorecard summarising the increase in forecast accuracy over the UK provided by post-processing compared to the raw output from MOGREPS-UK for use as a key performance indicator (KPI)

### **Near-surface weather parameters**

- 2-metre temperature
- 1-metre wind speed
- Precip accumulation (1-hour and 3-hour)
- Total cloud cover
- Visibility

Verified against 117 quality-controlled surface stations in the UK

### **Forecast ranges**

Nowcast, short-range and medium-range up to T+120:

T+1, 2, 3, 6, 12, 24, 36, 48, 72, 96, 120

### **Metrics**

- Ranked probability score (RPS)
- Continuous ranked probability score (CRPS)

# Verification data storage and management

- Forecasts and matched observations stored in an Oracle database
- Over 2 terabytes of data in total so far
  - Over a year of hourly datetimes
  - Hourly lead times to T+120
  - 117 stations
  - 6 weather parameters
- Accessed from our Python-based verification front-end system using an SQL library (sqlalchemy)

## MOGREPS-UK ensemble

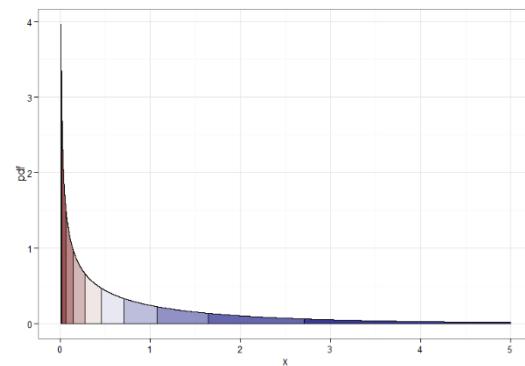

Date and time	Station ID	Lead time	Parameter	Obs	Member 0	Member 1	...

## IMPROVER percentiles

Date and time	Station ID	Lead time	Parameter	Obs	5 <sup>th</sup> percentile	10 <sup>th</sup> percentile	...

# Percentile forecasts

- IMPROVER outputs both percentiles and threshold exceedance probabilities
- Every 5<sup>th</sup> percentile:  
5%, 10%, 15%, ... , 90%, 95%  
(*ventiles, vigintiles, or demi-deciles*)
- Many more than 20 thresholds for some variables
  - Temperature: intervals of 1°C between -20°C and 50°C
- Percentiles are more efficient and simpler to store
  - Typically more closely-spaced so contain more information
  - Simpler to store as there are the same number for all variables

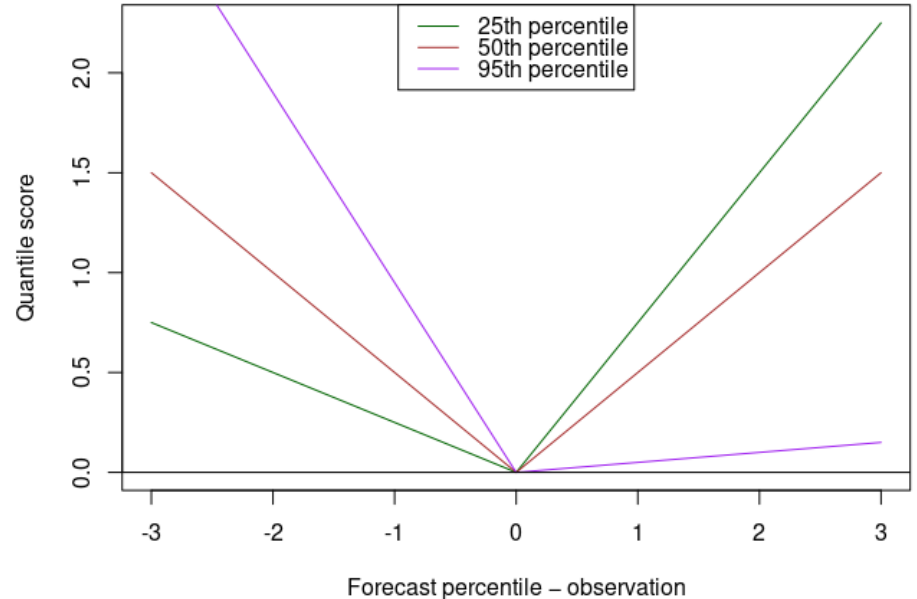

Deciles of normal and  $\chi_1^2$  distributions

# The quantile score

The **quantile score** is a proper score for a quantile or percentile forecast. For an observation  $y$  and a forecast  $x_\alpha$  for the  $\alpha$ -quantile,

$$QS = \begin{cases} (x_\alpha - y)(1 - \alpha), & y \leq x_\alpha \\ (y - x_\alpha)\alpha, & y > x_\alpha \end{cases}$$

- For the median (50<sup>th</sup> percentile), the QS is equal to half the mean absolute error
- The QS is zero for the 0% and 100% quantiles provided the observation lies in between them.

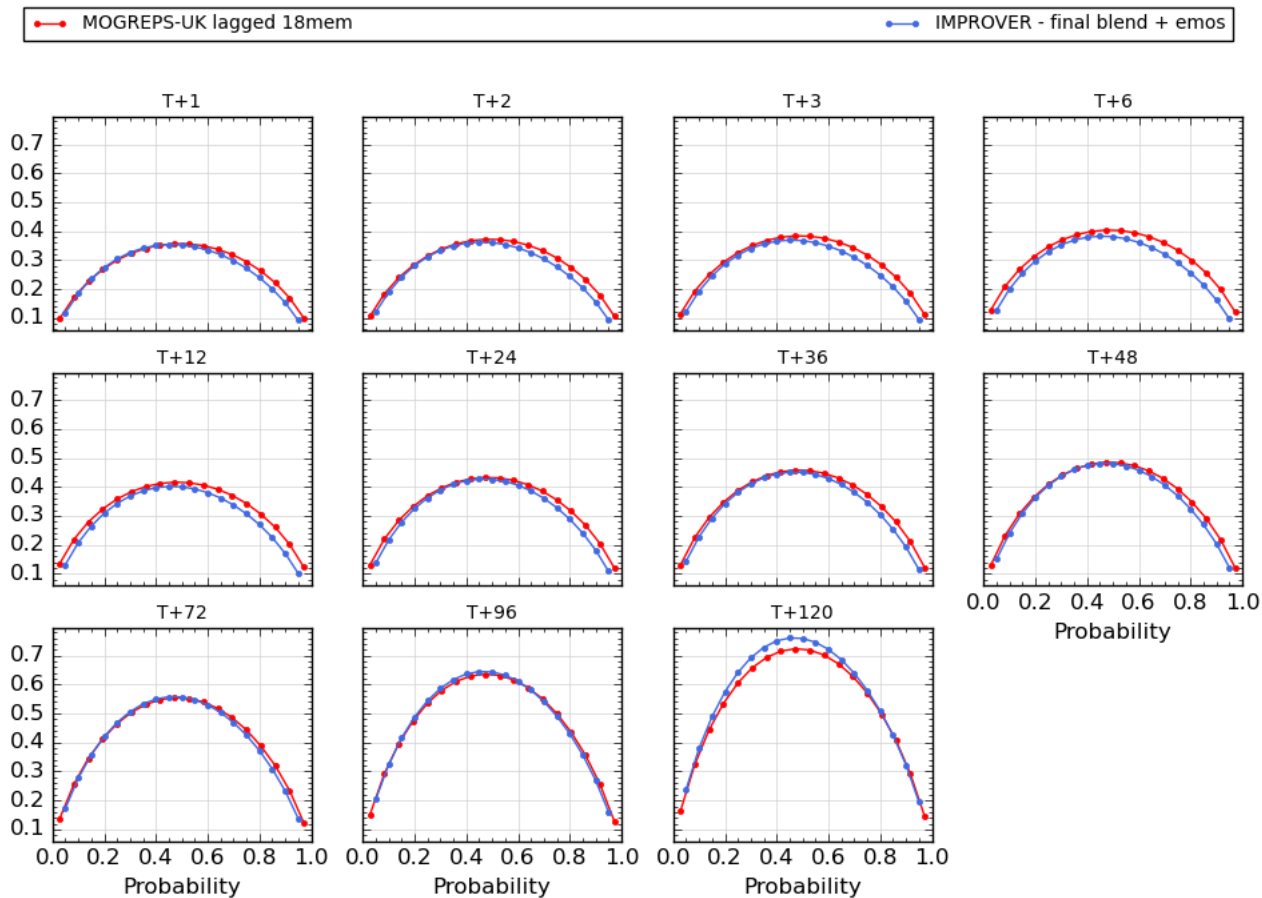

# CRPS from quantile scores

- **For a continuous distribution**, the CRPS is equal to twice the integral of the quantile score over the quantile level  $\alpha$ .
- **For an ensemble**, Bröcker (2012) shows that the CRPS can be written as the mean of the quantile scores applied to the individual members, using level  $(k - 0.5)/M$  for the  $k^{\text{th}}$  of  $M$  ensemble members.
  - So with  $M = 19$ , the appropriate quantile levels are 0.026, 0.079, 0.132, ... 0.974

# Quantile scores for temperature

- Up to T+72, IMPROVER has a better score than MOGREPS-UK at higher quantiles
- At T+120, IMPROVER appears worse around the middle of the distribution

# How to calculate CRPS from a set of discrete quantiles?

5%, 10%, 15%, 20%, ... 95%

MOGREPS-UK

Bröcker's instructions are equivalent to the midpoint rule

IMPROVER – which is the most appropriate?

Average the quantile scores for the 19 percentiles

Midpoint rule using only 5%, 15%, 25%, ... 95%

Simpson's rule

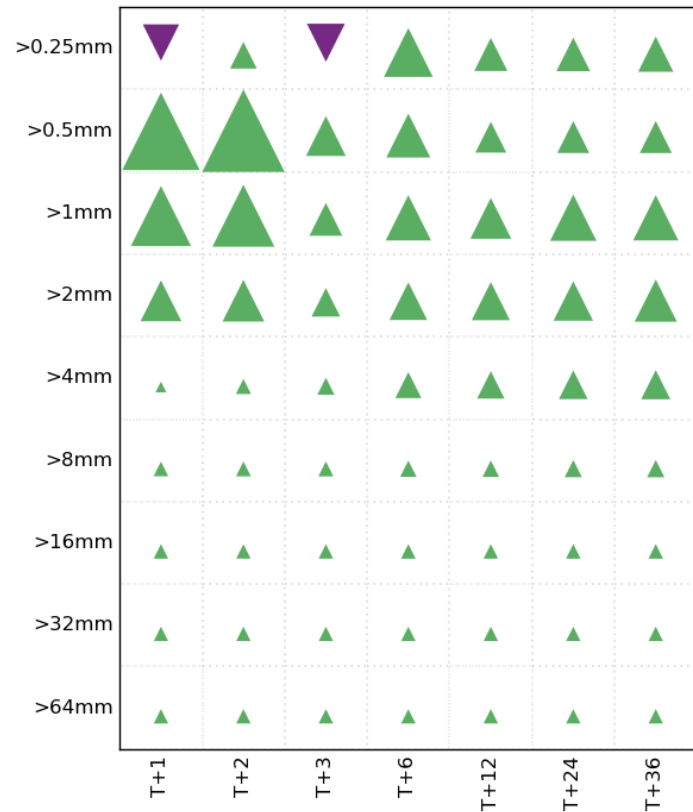

# RPS and Brier scores

The RPS is the sum of Brier scores across thresholds.

It seemed reasonable to assign probabilities:

- 0.075, 0.125, ... 0.925 to thresholds lying between IMPROVER's percentiles
- 0.025 (0.975) to thresholds lying below the 5<sup>th</sup> (above the 95<sup>th</sup>) percentile
- $(k + 0.5)/19$  for  $k = 0 \dots 18$  to MOGREPS-UK ensemble member counts, giving 0.026, 0.079, 0.132, ... 0.974

⇒ IMPROVER scores better for extreme categories, including those that were never observed and were forecast with the smallest possible probability for both systems!

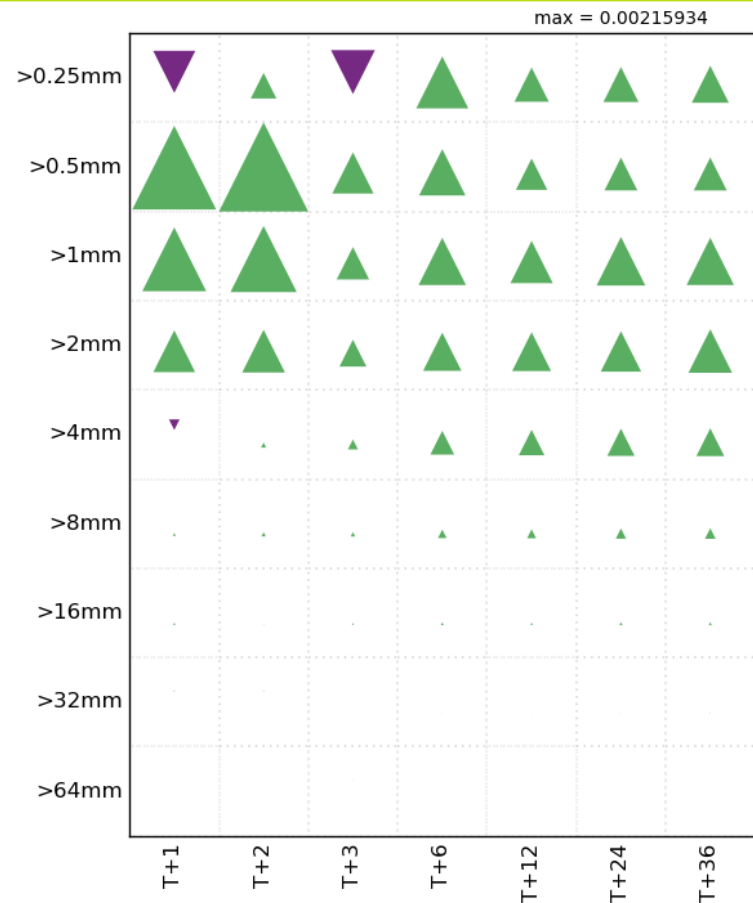

Differences in Brier scores between the two systems

# A fix

- One alternative is to change the assignment of probabilities to MOGREPS-UK member counts.
- In general for an  $M$ -member ensemble, you can assign probabilities  $(k + a)/(M + 2a)$  for a chosen value of  $a$  between 0 and 1.  
(Wilks, 2019: *Statistical Methods in the Atmospheric Sciences* sections 8.3.1 and 3.3.7)
- Choosing  $a = 9/19$  instead of  $1/2$  results in the smallest probability that can be issued being the same for both systems, namely 0.025
- This gives zero difference between the Brier scores for the two systems in the extreme categories.

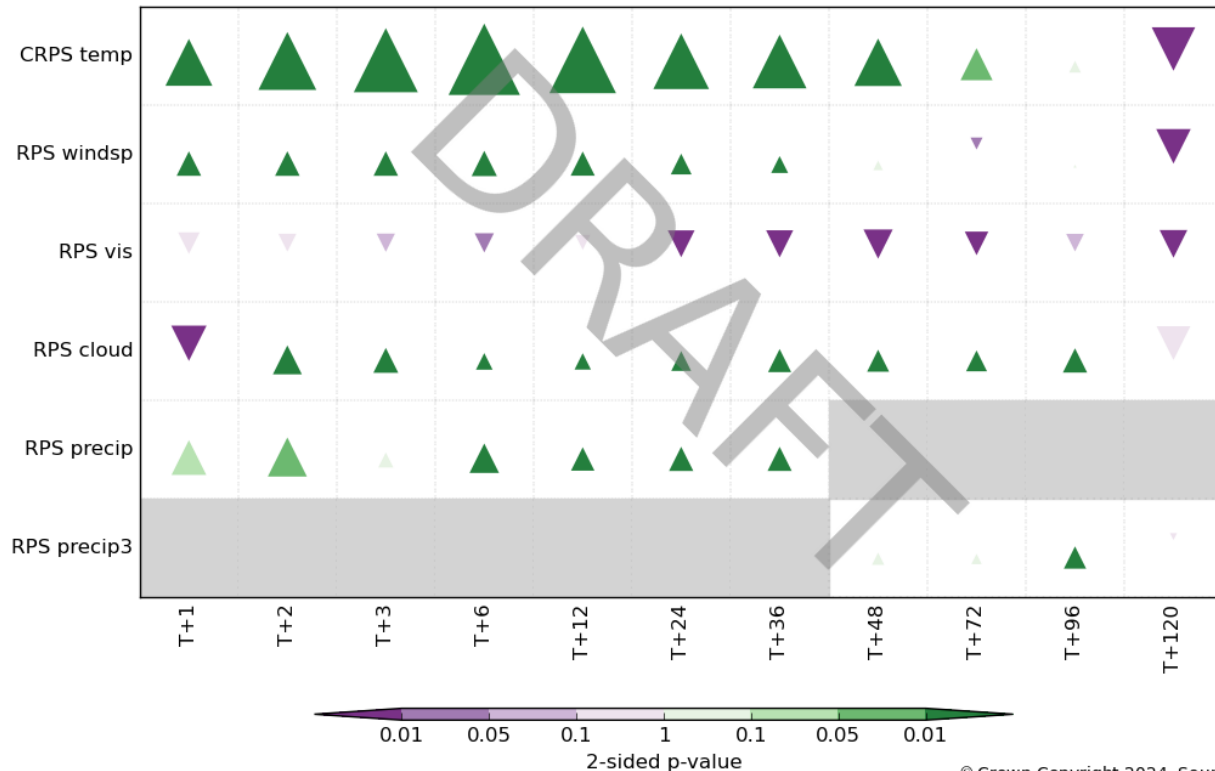

[plot source](#)

# Summary scorecard

- Size of triangle indicates magnitude of the percentage difference
- Orientation and colour indicates sign of difference
- Shade of colour indicates p-value (adjusted for serial correlation using AR(1) variance inflation applied to daily means of score differences)

Scores averaged over April 2023 to March 2024

# Summary

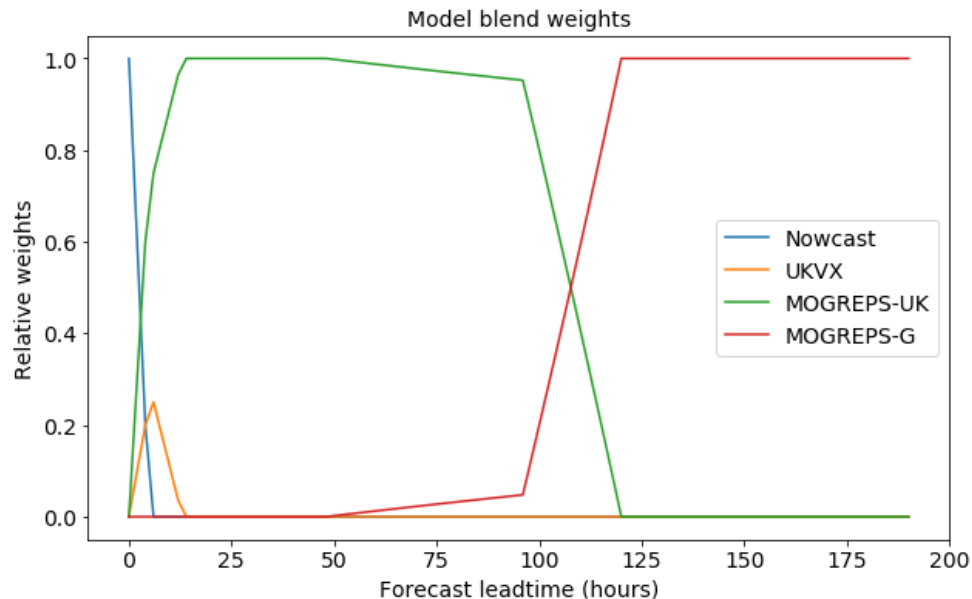

- Storing post-processed spot forecasts as percentiles allows flexible fully probabilistic verification and comparison to an ensemble
- Quantile scores give insight into benefits of post-processing at extremes
- Calculation of CRPS, Brier scores and RPS needs some care to ensure a fair comparison
- The IMPROVER project has successfully delivered a new Met Office blended probabilistic forecast
  - ... and verification will be essential to its continued improvement

# Extra slides

# Model blending

- MOGREPS-UK dominates the weighting at T+6 to T+96, and currently runs out to T+120.
- Its weight tapers to zero at T+120 to give a smooth transition to the global ensemble MOGREPS-G

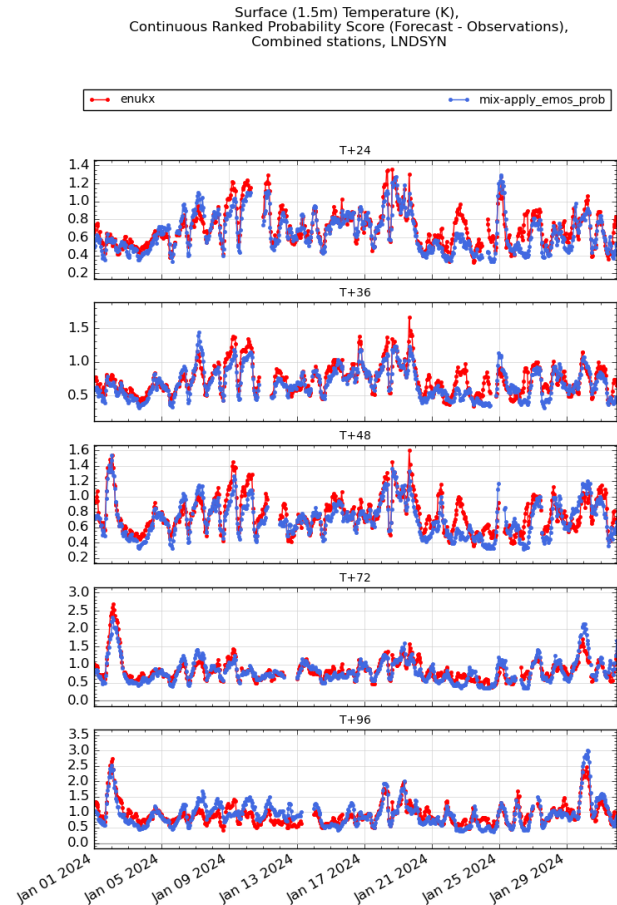

# Beyond the scorecard

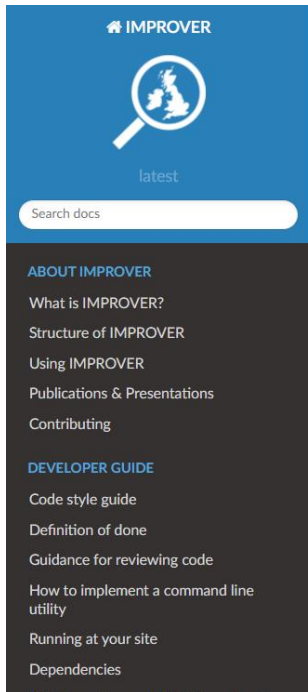

e.g. monitoring CRPS for temperature over Jan 2024

- Sometimes both systems do poorly (large CRPS) e.g. around 19th
- Sometimes MOGREPS-UK has a large peak where IMPROVER doesn't, e.g. 23<sup>rd</sup>

# IMPROVER code is open-source: [improver.readthedocs.io](https://improver.readthedocs.io)

The screenshot shows the IMPROVER documentation website. At the top, there is a blue header with the IMPROVER logo (a magnifying glass over a map of the UK) and the word "latest". Below the header is a search bar labeled "Search docs". The main content area is dark grey and contains a navigation menu with sections: "ABOUT IMPROVER" (including links for "What is IMPROVER?", "Structure of IMPROVER", "Using IMPROVER", "Publications & Presentations", and "Contributing") and "DEVELOPER GUIDE" (including links for "Code style guide", "Definition of done", "Guidance for reviewing code", "How to implement a command line utility", "Running at your site", and "Dependencies").

The screenshot shows the GitHub repository page for IMPROVER. The repository name is "IMPROVER: Probabilistic meteorological post-processing". It includes a link to "Edit on GitHub". The title is "IMPROVER: Probabilistic meteorological post-processing". Below the title, there are tags for "License BSD 3-Clause", "python 3.6", and "Build Status". The description states: "IMPROVER is a project being led by the Met Office in the UK to create a probabilistic post-processing system for ensemble weather prediction models. The aim is to extract the best possible probabilistic forecasts from multiple ensemble models, combining data from convection permitting and coarser resolution forecasts into a seamless blend." Below the text is a figure titled "Probability of Air Temperature Exceeding Threshold - 09 UTC on Tue 06/08/2019". The figure consists of three maps of Europe showing the probability of air temperature exceeding a threshold of 13 °C, 15 °C, and 17 °C. A color scale at the bottom indicates probability percentages from 1 (dark purple) to 99 (yellow).
